

Vue.js Tuto

1. How to start Vue.JS Project

- To install the Vue CLI globally on your machine.

```
npm install --global @vue/cli
```

- To update the globally installed Vue CLI package to the latest version available on npm.

```
npm update --global @vue/cli
```

- To create a new Vue.js project using the Vue Command Line Interface. This command initializes a new Vue project with all the necessary files and configurations to get started with Vue development.

```
vue create my-vue-project
```

- To navigate into the newly created project directory.

```
cd my-vue-project
```

- To open the project in Visual Studio Code using the command

```
code .
```

- To run the development server and serve the project locally during development.

```
npm run serve
```

data-binding
